add tis is proxy for biodiesel price

PME_COST$_t$ (i) Fitted Palm Methyl Ester production cost in RM per tonne. This is the cost-equation output, distinct from an observed PME market price.

CPO$_{t-1}$ (i) Crude Palm Oil price in the preceding month, in RM per tonn

Methanol$_t$ current-month methanol cost in RM per tonne.

Glycerol$_t$ current-month crude glycerine price in RM per tonne.

i prefer u write : pme cost (proxy for price of biodesel)

t / t−1 current month / preceding month.

$$\mathrm{PME\_COST}_t = 168.9537 + 1.0540 \cdot \mathrm{CPO}_{t-1} + 0.1117 \cdot \mathrm{Methanol}_t - 0.0945 \cdot \mathrm{Glycerol}_t$$

How to read it

Purpose: estimate PME production cost from input prices. OLS estimates these fixed coefficients; HAC adjusts their uncertainty. The cointegration test separately evaluates H1 and coefficients. The price sliders compare selected diesel and PME assumptions; they do not refit this equation.

What do these numbers mean? ⓘ ···

Constant	Lagged CPO	Methanol	Glycerol credit
168.9537	1.0540	0.1117	-0.0945
The fitted baseline is RM 168.95/t when all included price inputs are zero. It mainly anchors the equation and is not a standalone policy price.	A RM1/t increase in preceding-month CPO is associated with RM 1.0540/t higher PME cost, holding methanol and glycerol constant.	A RM1/t increase in methanol cost is associated with RM 0.1117/t higher PME cost, holding the other included prices constant.	A RM1/t increase in crude-glycerine value is associated with RM 0.0945/t lower net PME cost, holding the other included prices constant.

it shuD be : prie of biodiesel (proxied by MOPS)

Current price test ⓘ ···

WHAT-IF CONTROLS Click any underlined control name for a plain-English definition. Move the two simulated-price assumptions to test the viability gap. The [illegible] coefficients stay fixed.

u shud write :price of biodiesel (proxied by pme cost)

Simulated diesel benchmark (MOPS proxy) ⓘ

RM 1,500.00/t **RM 3,610.80/t** RM 6,000.00/t

Simulated PME cost proxy ⓘ

RM 1,500.00/t **RM 4,728.53/t** RM 6,000.00/t

VG = RM 3,610.80/t − RM 4,728.53/t

Modelled PME cost exceeds diesel benchmark; the absolute gap indicates indicative support pressure per tonne.

add a floating blining pop up green to indicate positive vg,,red negative vg

-RM 1,117.73/t

I TOT COINTEGRATION SHUD USE SAME VARIABLES AS THE PME COST FUNCTION

,,N JST EXPLAIN THE PURPOSE OF COINT TST ,,,N HOW IT AFECT THE PME COST VALIDITY FUNCTION

What does the cointegration test mean?

TECHNICAL MEANING	IN PLAIN LANGUAGE	DECISION RULE
Cointegration is a stable long-run relationship among drifting price series. The Johansen trace test evaluates how many independent long-run relationships, called the cointegration rank, are supported.	It asks whether real biodiesel export unit value, CPO and Brent converted to MYR remain tied to at least one lasting price pattern over time.	Rejecting rank zero supports at least one cointegrating relationship. The sequential rank tests select rank two at lags 1–2 and rank one at lags 3–8.

Current finding: Rank zero is rejected at 5% for 8 of 8 tested lag settings. Cointegration is therefore supported in this real-data proxy system. Rank one is selected in 12 settings and rank two in 4.

PME is the published aggregate Malaysian biodiesel export unit value, not a quoted PME FOB price; CPO replaces MOPS. This supports a real proxy-system relationship, not the proposal's exact PME–MOPS–Brent H1. The separate cost equation remains OLS-HAC.

OLS-HAC intercept ⓘ	168.95	Fitted eq
Lagged CPO feedstock term (CPO t−1) ⓘ	4,554.45	Fitted eq

Break-even CPO threshold ⓘ
RM 2,841.3/t

I DONT KNOW WHERE THUIS NUMBER COME FROM

Difference at this grid point ⓘ
RM -227.6/t

Magnified difference scale: RM0–1/t. Across the full reviewed grid, the difference ranges from RM-313/t to RM1/t.

Break-even means the viability gap is zero. MOPS Diesel equals modelled PME cost. The green line is the CPO price at which that equality occurs for each Brent case, holding methanol and glycerol fixed. It is a threshold for comparison, not the current gap or a B30 approval by itself.

I DONT KNOW WHERE THIS NUMBER COME FROM ;; FROM TAB RQ 1 ONWARDS, ANY NUMBER THT THE DASHBOARD PRODUCE SHU BE HYPERLINKED OR TRACED TO ITS ORIGIN ,,EG MASTER EXCEL FILE , OR JUST FROM HTML TAB,,,N THERE SHUD BE A FLOATING ICON DYNAMIC TO THE NUMBER TO EXPLAIN HOW IT IS CALCULATED , N THE MEANING OF IT

2.	**Skop Kajian**	Kajian ini akan memberikan tumpuan kepada empat komponen kritikal bagi memastikan kelestarian mandat biodiesel nasional: **Komponen 1: Analisis Dinamik Harga & Pasaran** i. Mengkaji korelasi antara harga *Mean of Platts Singapore* (MOPS) Diesel dengan *Palm Methyl Ester* (PME). ii. Mengenal pasti titik pulang modal (break-even point) di mana mandat B30 memberikan keuntungan fiskal kepada negara. **Komponen 2: Mekanisme Pembiayaan Kendiri (*Self-Funding Mechanism*)** i. Pembangunan model Tabung Penstabilan Biodiesel untuk menguruskan lebihan simpanan subsidi semasa harga petroleum tinggi. ii. Kajian struktur percukaian sawit sebagai sumber dana alternatif. **Komponen 3: Model Mandat Fleksibel (*Dynamic Mandate*)** Mengkaji kebolehlaksanaan melaraskan tahap adunan (B20/B30) secara automatik berdasarkan jurang harga pasaran tanpa mengganggu rantaian bekalan
